

1 ABSTRACT

2 A garbage can which has: a) a bottom section; b) a top section; and c) a connecting means
3 for connecting the bottom of the top section to the top of the bottom section. The bottom section
4 has at least one axle; and at least one wheel. The top container defines a slanted bottom
5 corresponding in shape to the slanted top of the bottom section so when separated the two
6 sections defines a slanted opening. The slanted opening is at an angle less than 90 degrees from
7 the back of the container. The axle tube has a first position and a second position along the
8 container bottom. The first position and second position releasably hold the axle when the axle
9 is in place. The bottom has a handle adjustable relative to the back of bottom section. The top
10 section has a removable cover. The top section has a bag grip to hold a bag over the opening
11 when the removable cover is removed.
